TITLE:

News in Brief (Kratkiye soobshcheniya) VI Congress of the Polish Association of Parasitology (VI s'yezd Pol'skogo obshchestva parazitologii)

PERIODICAL: Vestnik Akademii nauk SSSR, 1959, Nr 4, pp 102-103 (USSR)

ABSTRACT:

The Congress was held in Lublin between October 19th and October 22nd, 1958 in connection with the 10th anniversary of the Association. More than 200 representatives of Poland took part in it as well as guests from the Soviet Union, Czechoslovakia, Hungary, Bulgaria, the German Democratic Republic, GFR, France and Yugoslavia. Among other delegates of the Soviet Union the academicians Ye. N. Pavlovskiy, K. I. Skryabin were present, both honorary members of the Association. On the occasion of the Congress a pamphlet on parasitology and Polish parasitologists was published. Apart from this, the programs of the reports and informations were published in a volume of "Parazitologicheskiye sveteniya" which were to be discussed on the Congress. The first two days were devoted to the achievements of Polish scientists in the field of parasitology. The further work was carried out by committees. The resolutions taken by the Congress were directed

Capitellus 8. Calculation of Axis Distance of V-Belt Driven Wheels.
Obliczanie odleg³o¶ci osi koli przy napêdzaniu pasami klinowymi".

Przegl±d Mechaniczny, No. 8, 1934, pp. 181-186, 2 figs, 3 tabs.

Rough methods of calculating the wheel axis distance with the V-belt drive arranged according to Polish Standards PN/G-821 and German Industry Standards DIN-2218, are here described. A new calculating method based on an exact formula is given and may conveniently be employed in practice. For calculating the belt length, a factor which may be read from a diagram is adopted, and for calculating the wheel distance, — a factor to be read from a table. The basis was the assumption that the exact calculation of the belt length is not necessary, since the calculated value is in most cases rounded off to the nearest catalogue standard length, even so appropriate accuracy is essential in the calculation of the wheel distance, after the belt length has been adopted. If for particular reasons an exact calculation of the belt length is required, this may, of course easily be made with the aid of the table.

Latest Design (Cont.)

POL/5033

COVERAGE: The book discusses the latest (up to 1959) trends in the development of some designs for chemical equipment. The authors deal specifically with progress in the design of absorption and distillation equipment, and latest developments in the design of gas compressors and sedimentation separators used in the chemical industry. No personalities are mentioned. References accompany each section.

813. SIGNIFICANCE AND TASKS OF STOMATOLOGICAL PROPHYLAXIS AT SCHOOL - Az iskolafogászati ellátás szociális jelentősége és feladataink -

Czappán E. - NEPEGESZSEGÜGY 1956, 37/8 (208-212)

The caries frequency in schoolchildren approaches 100%, and the number of caries-affected teeth per child is also increasing. An important weapon in the campaign against caries is found in prophylactic stomatological measures at school (preventive care of permanent teeth and education in oral hygiene). It seems profitable to extend this prophylaxis to the age group 3-18. No definite data are as yet available as to the efficacy of fluorine prophylaxis; the measures against rickets are at the same time effective against caries. Stomatological prophylaxis should be supplemented by the treatment of malpositions (to be organized by the central orthodontal institute).

TITLE: Semiconductor high-pressure gage

SOURCE: Przeglad elektroniki, no. 3, 1965, 134-137

TOPIC TAGS: semiconductor high-pressure gage, pressure gage, tellurium pressure
gage

ABSTRACT: Tellurium single crystals for use in semiconductor high-pressure gage
were investigated at the Institute of High-Pressure Physics of the Academy of
Sciences USSR. A system for creating hydrostatic pressures up to 20,000 atm was
used. The measurement principle was as follows. The changes in tellurium elec-
trical resistance caused by pressure were measured by a bridge circuit with a
bridge, and the pressure was measured by a thermocouple. On the basis
of the following results, the following conclusions were drawn:

1) high reliability of the gage; 2) high accuracy of measurement, especially at
30,000 atm; 4) simple construction; and 5) a long service life. Orig. art. nos.

AUTHOR: Czarczyński, Wojciech

TITLE: A platinotron

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 10, 1962,
20, abstract 10-3-39d (Prace przemysł. inst. elektroniki, 1961, v.
2, no. 2, 67 - 76; Polish; summaries in English, Russian)

TEXT: The platinotron is a powerful high-voltage tube, used either as amplifier or oscillator. Its amplification factor is small (~ 10 dB). The bandwidth is 5 to 10%. The efficiency is 70%. The pulsed power of a mass-produced platinotron is only a few kilowatts. In principle, platinotron action is analogous to that of the magnetron. From the structural point of view, the most characteristic property is the delay line, consisting of flat rings arranged in loops, under pulsed loads, its length being close to a half-wave length. These loops also play the part of anode segments. The basic condition of interaction between the electrons and the electromagnetic wave is the equality of the angular velocity of the electrons and the phase velocity of the space harmonic, with which they

TITLE	: Polarographic Determination of Lead with a Background of Ascorbic Acid.	
ORIG. PUB.	: Chem. analit., 1958, 3, No 3-4, 501-504	
ABSTRACT	: It was found that with a background of ascorbic acid (I), Pb produces a well defined wave at about - 0.42 v and pH about 4. The use of solutions of I as the background permits to obviate the interfering effect of Sn ²⁺ and Cd ²⁺ , the waves of which, under the selected conditions, are fully separated from Pb wave. To determine Pb, the sample of material being analyzed, containing not more than 10 mg Pb, is dissolved according to one of the suitable methods. In the presence of interfering ions (UO ₂ ²⁺ , Tl ⁺ , large amounts of Sn ²⁺ , Cu ²⁺) Pb is separated by precipitation with H ₂ SO ₄ or K ₂ Cr ₂ O ₇ (in the latter case, precipitation is effected in neutral solution). Precipitate of

ABSTRACT : PbSO ₄ is dissolved with heating in solution of CH ₃ COONH ₄ , while PbCrO ₄ precipitate is dissolved in dilute HNO ₃ . The resultant solutions are diluted with water to 50 ml, 1-5 ml of this solution (10 ⁻³ - 10 ⁻² mg/ml Pb) are taken, 1 g I is added, diluted with water to 7-8 ml, pH is adjusted to 4 with NH ₄ OH (solutions containing Cu are adjusted to pH 5), 2 drops of 0.05% solution of gelatin are added, the mixture is diluted with water to 10 ml, N ₂ is passed into it, and polarography is carried out. The method permits determination of Pb at concentration up to 10 ⁻⁶ M; optimal concentration of Pb (error not exceeding 4%) is in the range 10 ⁻⁴ - 10 ⁻³ M. The method is recommended for determination of Pb in various ores, in metallic Zn and its alloys, in organic compounds, etc. -- A. Nemodruk.
